**Print Register Stepping Motors Replacement Program**

On most wide web Chadwick pre-print presses, the longitudinal print register is controlled by a small stepping motor usually mounted within the print roller bearing housing cap.

As the presses become older, the longitudinal register motors can sometimes have difficulty in moving the print gear and register sleeve on the print roller journal. This can affect print quality, waste levels and create excessive downtime on the press.

PPT is now offering its Chadwick wide web press customers the opportunity to purchase replacement longitudinal register stepping motors with modern equivalents that produce up to **50% more power (torque).**

As with the existing motors, the new replacement motors will still be mounted in the print roller bearing housing cap.

Should you be experiencing register adjustment issues then this upgrade may resolve your problems.

Should you require a quotation to replace the longitudinal register stepping motors, please contact PPT at the earliest opportunity ([sales@preprinttech.com](mailto:sales@preprinttech.com))
